TECHNICAL MEMORANDUM No. 1.1.5.7

2005 SEDS DATA INPUTS FOR BPM

1.1 INTRODUCTION

The purpose of Technical Memorandum 1.1.5.7 is to present the sources for and methodology of data collection for the updated data inputs at the traffic analysis zone (TAZ) level for the New York Metropolitan Region¹ for use with the New York Best Practices Model (NYBPM).

For the draft technical memorandum, county subdivision data for Bergen, Essex, Hunterdon, Mercer, Middlesex, Monmouth, Morris, Ocean, Passaic, Somerset, Sussex, Union, Warren, Fairfield, and New Haven Counties and census tract data for Bronx, Kings, New York, Queens, Richmond, Nassau, Suffolk, Dutchess, Orange, Putnam, Rockland, Westchester, Hudson Counties, and the City of Newark were presented. In the final technical memorandum, these data are converted to the TAZ level and are provided for input to the NYBPM. The indicators include employment, population, labor force, households, earnings, income, and school enrollment. These indicators will be utilized by the NYBPM to determine future transportation needs. These data will also be used directly in the construction of socioeconomic forecast models which will be applied to the analysis of future patterns of transportation demand.

The following sections present discussions of the sources for and methodology of data collection organized by the major data groups: employment, population, labor force, households, earnings, income, and school enrollment. In many cases, methodologies differ from state to state due to variations in data availability or collection methods.

2.1 POPULATION DATA COLLECTION

Total, household and group quarters population data for county subdivisions and census tracts are provided for 2005. The annual intercensal estimates for total population at the county subdivision level were obtained for 2005. These estimates are prepared by the Federal State Cooperative Program for Population Estimates (FSCPPE) and are provided by the U.S. Bureau of the Census for all county subdivisions in the NYMTC study area. Population data are estimated as of July 1 of each year. The previous years' estimates are revised annually.

Census tract total population was disaggregated from the 2005 Population Estimates by county subdivision using the 2000 decennial census total population proportions of census tract to municipality.

¹ The New York Metro Region for this TM includes the following counties: Bronx, Kings, New York, Queens, Richmond, Nassau, Suffolk, Dutchess, Orange, Putnam, Rockland, Westchester, Bergen, Essex, Hudson, Hunterdon, Mercer, Middlesex, Monmouth, Morris, Ocean, Passaic, Somerset, Sussex, Union, Warren, Fairfield, and New Haven Counties

Population subsets data for residents living in households, institutional and non-institutional group quarters were also collected. Group quarter's data for 2005 from the Census Population Estimates were available only at the county level. Group quarters population (total and in institutions) by county subdivision was purchased from Claritas², a commercial purveyor of demographic data. Claritas is a comprehensive online resource for marketing analysis. The Claritas county subdivision data were used to proportionally distribute the Population Estimates county data of group quarters population. In addition, census tract group quarters population was disaggregated from the 2005 county subdivision data using the 2000 decennial census group quarters population proportions by census tracts.

Data on the homeless population, a subset of the non-institutional group quarters population, were gathered from a table in a special report of the 2000 decennial census, "Population in Selected Group Quarters for the United States, States, Counties With 100 or More People in Emergency and Transitional Shelters, and Census Tracts With 100 or More People in Emergency and Transitional Shelters, and for Puerto Rico: 2000."³ The 2000 homeless population was utilized because it is the most recent count and since group quarters population as a whole does not vary greatly from year to year. For New York State, the special report specified a count of the homeless population in certain census tracts. The homeless population reported for these tracts was used as listed; while the remainder of each county's homeless population was distributed using the 2005 group quarters proportions.

For Connecticut and New Jersey, county homeless population of the special report was distributed to the minor civil division (MCD) and tract level using the 1990 Census⁴ proportion of homeless population to total group quarters population.

Population in households was derived by subtracting the group quarters population estimate from the total population estimate for all areas.

3.1 HOUSEHOLD DATA COLLECTION

Household formation characteristics pertain to the number of households, population in households, and average size. The methodology for obtaining the population in households estimate was explained in the previous section.

Connecticut's total number of households by county subdivision was gathered from 2005 town profiles prepared by the State of Connecticut. New York's census tract households were distributed from the 2005 American Community Survey county totals using the 2000 decennial census tract to county proportion of total households. In view of the fact that no such data were available for New Jersey, that state's total number of households was determined by dividing population in households by the average household size.

² Claritas, <http://www.claritas.com>; Access Data January 2007.

³ Smith, Annette & Denise Smith. "Emergency and Transitional Shelter Population: 2000," issued October 2001. Census 2000 Special Report.; www.census.gov. Access Date February 2007.

⁴ The 2000 Census does not have an indicator specifying homeless population.

Average household size was calculated by dividing population in households by the total number of households for MCDs in Connecticut and tracts in New York. Average household size was taken from the 2000 Census and held constant for 2005 in New Jersey due to the absence of household estimates as noted in the previous paragraph.

4.1 LABOR FORCE DATA COLLECTION

Average annual labor force data have been collected for the twenty-eight counties in the NYBPM study area of the New York Metropolitan Region. The labor force data include resident civilian labor force, resident employed labor force, and resident unemployed labor force. Labor force data differ from employment data in that labor force data enumerate resident workers and nonworkers, regardless of place of work. Employment data enumerate workers by place of work, regardless of place of residence. The 2005 data were collected from New York, New Jersey, and Connecticut Departments of Labor (DOLs).

The DOL labor force data are collected on a monthly basis and become available approximately two months after collection. Average annual data are also available once the appropriate monthly data have been finalized. The data are periodically rebenchmarked to make them more consistent with the results of the most recent Census or with changes dictated by the Federal Bureau of Labor Statistics (BLS), which oversees the DOLs. The 2005 data from New York, New Jersey, and Connecticut were benchmarked to 2005.

Civilian labor force, resident employment, and unemployment data for the Region can also be centrally retrieved from the US Bureau of Labor Statistics. The data are compiled by the Local Area Unemployment Statistics (LAUS) program, a Federal-State cooperative effort in which monthly estimates of total employment and unemployment are prepared for approximately 6,800 areas, including metropolitan areas, nonmetropolitan labor markets, counties and county equivalents, and cities.

DOL data have annual-average values for resident civilian labor force, resident employment, and resident unemployment. The DOLs, under the guidance of the BLS, typically collect monthly statistics by Labor Market Area (LMA) from the Current Population Survey (CPS), the Current Employment Survey (CES), and unemployment claims data. The statistics are then adjusted by a computer software package, Power Builder, provided by the BLS to generate labor force numbers. Because of the reliance on unemployment claims data, this methodology is subject to underestimation of unemployment, as long term unemployed people eventually are no longer able to file claims.

Connecticut and New Jersey LAUS data were available by county subdivision and are presented as is for this Technical Memorandum. For the census tracts in the City of Newark and Hudson County, the 2000 decennial census proportions were used to distribute the county subdivision labor force to its component tracts. For New York, 2005 LAUS data were obtained by county. The 2000 decennial census ratio of labor force to population in households was applied to the 2005 population in household's tract estimates to distribute the county labor force data.

5.1 EMPLOYMENT DATA COLLECTION

In order to gain a comprehensive view of regional economic development, employment data have been collected by industry for 2005.

The employment categories reported in this Technical Memorandum are:

- Total
- Office
- Retail
- Other

Census Transportation Planning Package (CTPP) data were used for the areas in New York, New Jersey, and Connecticut. CTPP is a set of special tabulations from the decennial census calculated for transportation planners. The data are tabulated from answers to the Census 2000 long form questionnaire. Because of the large sample size, the data are precise. CTPP provides complete and efficient data, in a traditional format, across the United States.⁵

From the previous series of NYMTC Demographic and Socioeconomic Forecasting Technical Memoranda, CTPP-based estimates for 2002 were obtained from TM 1.2.2, *Employment Model*.⁶ These estimates were used as the basis for the 2005 employment estimates by applying yearly growth rates from the Department of Labor's ES-202 data. The ES-202 data did not include government employment; Regional Economic Information System (REIS) data from the Bureau of Economic Analysis provided government employment by county.

Average annual employment from the Quarterly Census of Employment and Wages (QCEW) was the source of ES-202 data from each state's Department of Labor. QCEW is a census of all employers liable for unemployment insurance (97-99% of total non-agricultural employment). This source excludes certain payroll employment not covered by unemployment insurance such as self-employed, unpaid family workers, railroad workers, student workers, and some agricultural workers. The quarterly data are available six months after the close of the quarter. The advantage of using this data is that it consists of a complete universe of employers and a fine level of geographic and industry detail, while its limitation is that there is a six month time lag and some data are suppressed for confidentiality purposes.

TM 1.2.2 CTPP-based estimates were organized by using 1990 Federal Information Processing Standards (FIPS) codes. The Census provided factors to convert 1990 FIPS to 2000 FIPS codes.

⁵ Department of Transportation; www.dot.gov. February 2007

⁶ TM 1.2.2 *Employment Model*. NYMTC 2030 Forecasts, September 7, 2001

6.1 EARNINGS DATA COLLECTION

Earnings data are critical in determining the supply and demand for all transportation projects. Similar to the employment data, Census Transportation Planning Package (CTPP) data were used for areas in New York, New Jersey, and Connecticut.

From the previous series of NYMTC Demographic and Socioeconomic Forecasting Technical Memoranda, 2002 CTPP-based estimates were used from TM 1.2.2, *Employment Model*.⁶ These estimates were used as the basis for the 2005 earnings estimates by applying yearly growth rates from the Department of Labor's ES-202 data.

7.1 HOUSEHOLD INCOME

Mean household income is provided for the twenty-eight counties at the MCD and tract level. Aggregate household income was taken from the 2000 Census Summary File 3 (SF3)⁷. County growth rates from the 2005 American Community Survey⁸ were applied to 2000 census tract and MCD data to obtain 2005 aggregate household income estimates. They were then divided by the number of households to derive mean household income.

8.1 ENROLLMENT DATA COLLECTION

Educational enrollment data are also an input to the NYBPM. Enrollment by school location in New York, New Jersey and Connecticut at primary and secondary levels of education, as well as universities, were acquired from each state's Department of Education.⁹

Connecticut and New Jersey's enrollment data were obtained by county subdivision. In New York, enrollment data were available by zip code. For the city of Newark and the counties of Hudson, Bronx, Kings, New York, Queens, Richmond, Nassau, Suffolk, Dutchess, Orange, Putnam, Rockland, and Westchester, enrollment was estimated at the census tract level using ratios of county subdivision/zip code-to-census tract enrollment based on prior small area enrollment estimates developed by Parsons Brinckerhoff.
